Student Learning Outcomes

- Demonstrate the use of geographic technologies to analyze real world problems and make informed, data driven decisions.
- Describe how to access different sources of data, describe the process of creating data with different geographic technologies, and discuss the fundamental concepts of data quality.
- Evaluate cartographic products in terms of their aesthetic design and ability to communicate information.
- Identify, explain, and interpret spatial patterns and relationships, such as how places are similar and different, the nature of transitions between places, and how places are linked at local, regional, and/or global scales.
- Describe how paper maps and Geospatial Technology can be used for geographic inquiry.
- Describe how GIS&T helps to solve problems of a spatial context.
- Interpreting maps and data.

Description

Introduction to the fundamental concepts of geospatial technology, including Geographic Information Systems (GIS), Remote Sensing (RS) and Global Positioning Systems (GPS), map reading, and cartography. Exploration of how geospatial technologies are used in addressing human and environmental issues and can promote sustainability.

Course Objectives

The student will be able to:

a. Describe how paper maps and geospatial technology can be used for geographic inquiry.

b. Describe the historical development of GIST.

c. Describe how GIST helps to solve problems of a spatial context.

d. Interpret maps and mapped data.

e. Evaluate cartographic products in terms of their aesthetic design and ability to communicate information.

f. Demonstrate the use of geographic technologies to analyze real world problems and make informed, data driven decisions.

g. Describe how to access different sources of data, describe the process of creating data with different geographic technologies, and discuss the fundamental concepts of data quality.

h. Identify, explain, and interpret spatial patterns and relationships, such as how places are similar and different, the nature of transitions between places, and how places are linked at local, regional, and/or global scales.

Course Content

a. Introduction to geospatial technology
   i. Describe and provide examples of applications of geospatial technology
   ii. Discuss the components of geospatial technology, including remote sensing, GIS, GPS and its relationships to other fields
   iii. Discuss the historical origins of the geospatial technology industry
   iv. Discuss codes of professional ethics and rules of conduct for geospatial professionals

b. Introduction to spatial reasoning
   i. Identify, explain, and interpret spatial patterns and relationships
   ii. Describe the scientific method, including the formulation of a problem, the collection of data through observation and experiment, and the formulation and testing of a hypothesis

c. Projections and coordinate systems
   i. Describe characteristics and appropriate uses of common geospatial coordinate systems
   ii. Discuss the roles of several geometric approximations of the earth’s shape, such as geoids, ellipsoids, and spheres
   iii. Describe characteristics and appropriate uses of common map projections

d. Cartography
   i. Demonstrate proficiency in map reading and interpretation
   ii. Demonstrate how the selection of data classification and/or symbolization techniques affects the message of the thematic map
   iii. Critique the design of a given map in light of its intended audience and purpose
   iv. Analyze the relationship between scale and the level of geographic detail in a representation
   v. Employ cartographic design principles to create effective and visually compelling printed and online maps

e. Geospatial data
   i. Identify and describe basic types of maps and geographic data used with a GIS, and how data is collected in the field
   ii. Compare and contrast raster and vector data structures and operations
   iii. Give examples of how GIS has been used in the modeling of physical and human processes, including environmental and sustainability issues
iv. Discuss the art and science of representing real-world phenomena in GIS

f. Data quality
   i. Discuss the elements of geospatial data quality, including spatial accuracy, resolution, precision, and fitness for use
   ii. Discuss the concept of uncertainty, and the ways in which it arises from imperfect representation of geographic phenomena

g. Methods of spatial analysis
   i. Use geospatial software tools to perform basic GIS analysis functions
   ii. Demonstrate the use of web mapping tools to study and develop possible solutions to real world problems

h. Satellite positioning and other measurement systems
   i. Describe the principles behind GPS, and some of its applications, including recreational, mapping, and surveying
   ii. Describe the basic components and operations of the Global Navigation Satellite System (GNSS), including the Global Positioning System and similar systems
   i. Remote sensing and photogrammetry
   i. Explain the difference between active and passive sensors, citing examples of each and how they are deployed
   ii. Differentiate the several types of resolution that characterize remotely-sensed imagery, including spatial, spectral, radiometric, temporal, and extent
   iii. Aerial and satellite imagery interpretation
   iv. Use the concept of the "electromagnetic spectrum" to explain the difference between optical sensors, microwave sensors, multispectral and hyperspectral sensors
   v. Define "orthoimagery" in terms of terrain correction and georeferencing
   vi. Demonstrate ways how remotely-sensed imagery can be incorporated into a GIS

j. Trends in geospatial technology
   i. Describe geoportals that allow remotely stored data to be discovered and accessed
   ii. Discuss future trends in geospatial technology

Lab Content
Not applicable.

Special Facilities and/or Equipment
1. Classroom with individual student computers with internet access
2. Instructor workstation with internet access and digital projector
3. When offered via distance learning, a course management system such as Canvas

Method(s) of Evaluation
Methods of Evaluation may include but are not limited to the following:

Quizzes
Problem sets
Tests
Projects

Method(s) of Instruction
Methods of Instruction may include but are not limited to the following:

Representative Text(s) and Other Materials

Although this text is older than the suggested "5 years or newer" standard, it remains a seminal text in this area of study.

Types and/or Examples of Required Reading, Writing, and Outside of Class Assignments
a. Weekly reading assignments from the textbook and objective quizzes
b. Written assessments that determine student’s mastery of course learning outcomes (SLOs)
c. Map analysis based project

Discipline(s)
Geography or Drafting/CADD or Environmental Technologies or Forestry/Natural Resources
